In this topic we design and implement various replication configurations for business process automation.

We'll review the conceps and use cases of snapshot, transactional and merge replication, along with their implementation details on MS SQL Server.

We'll also review the concepts and practical considerations of log shipping, a technology using similar methods as replication, but with the aim of preparing for disaster recovery.

After completing this topic

- you will understand the basic objectives, use cases and concepts of replication
- you will be able to select the right type of replication for a scenario
- you will be able to design and implement a replication solution with SQL Server
- you will be able to design, start and manage a log shipping system
