In this topic we'll present different ways of measuring the quality of data stored in various forms at a company

We'll also review the concepts and practical considerations of designing and implementing automated or interactive methods to improve the quality.

After completing this topic

- you will understand the hard and soft dimensions of data quality
- you will be able uncover hidden business rules in structured company data
- you will be able to design and run data cleansing and knowledge discovery projects using the MS DQS infrastructure
